

Yeastar Remote Management

Manage and Monitor Customer Premises S-Series VoIP PBX Easily and Securely

Yeastar Remote Management is a centralized management platform that allows easy management and configuration of S-Series VoIP PBX remotely in the cloud. All customer-premises S-Series VoIP PBXs can be securely monitored and managed. And the user can receive alarms of any unusual events and take actions accordingly.

How Will You Benefit

Easy Remote Management

Yeastar Remote Management provides better operation for remotely managing customer-premises S-Series VoIP PBX. It opens a secure SSH tunnel to remotely configure the customer's PBX and frees the client's computer. And clients can get Level 2 technical support by sending the link to equipment supplier when problem arises.

Not One-time Business

Yeastar does not sell directly to end user organizations. Besides selling the hardware devices, our partners can monetize support services with Remote Management Tool and maximize profits. And providing clients with excellent technical support will prove the most important part in continued revenue.

Improved Security

With Remote Management Tool, it's not necessary to do port mapping or open the firewall port when remotely accessing clients' PBX. The remote connection is HTTPS secured and conducted in encrypted SSH tunnel. Device connection authentication and role-based access control provide admin with peace of mind.

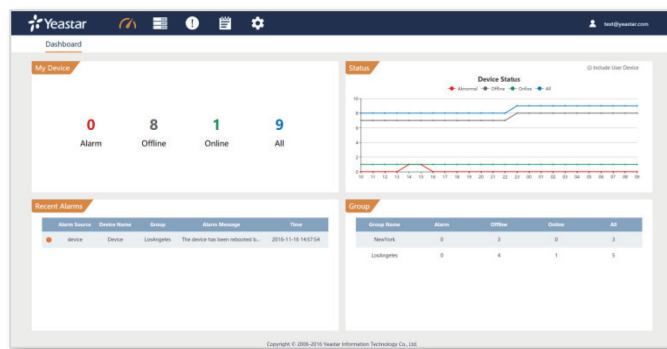

Real-time Monitoring

Automatically monitor the device status and send warning message to the admin when problems occur. 20 types of alerts notify admin of device disconnection, SIP trunk registration failure, system overload, network attack, and more.

What You Can Have

Everything in Insight

The dashboard presents an overview of device connection status, status change over time, details of recent alarms, and a summary of device status by group, so you can keep abreast of changes in a timely manner.

The 'My Device List' table displays a detailed list of devices, including their status, name, group, serial number, model, and expiration date. It also includes action icons for each device.

ID	Status	Name	Group	Serial Number	Model	Expires	Operation
1	Online	Device	Linkages	3093216278	Yeastar S100	N/A	[Icons]
2	Offline	S2000	Linkages	S2000	PC model	N/A	[Icons]
3	Offline	S2001	Linkages	S2001	PC model	N/A	[Icons]
4	Offline	S2002	Linkages	S2002	PC model	N/A	[Icons]
5	Offline	S2003	Network	S2003	PC model	N/A	[Icons]
6	Offline	S2004	Network	S2004	PC model	N/A	[Icons]
7	Offline	S2005	Network	S2005	PC model	N/A	[Icons]
8	Offline	S2006	Linkages	S2006	-	N/A	[Icons]
9	Offline	Alarm1	-	-	-	N/A	[Icons]

My Device List

All the authenticated devices can be found in the list, where you can see which device is online/offline, access device remotely, add administrator to the device, edit or delete the device.

Role-based User Access

Create sub-accounts with different roles (distributor, reseller, end user) and assign individual devices to relevant users. Comprehensive logs include operation date, operation type, device serial number, operator, and operator's IP.

The 'User Device List' table shows the assignment of devices to users. It includes columns for user ID, device ID, serial number, model, and administrator status.

User ID	Device ID	Serial Number	Model	Administrator
1	S2000	S2000	S2000	[Icon]
2	S2001	S2001	S2001	[Icon]
3	S2002	S2002	S2002	[Icon]
4	S2003	S2003	S2003	[Icon]
5	S2004	S2004	S2004	[Icon]
6	S2005	S2005	S2005	[Icon]
7	Yeastar S100	3093216278	F436L40101873A	[Icon]
