Product Overview
Hotel & Hospitality

Snom telephones for the hotel and hospitality industry

Snom phones have a long tradition of use in the hotel and hospitality industry. Now we have introduced a comprehensive range of devices to meet all of the special demands of the industry.

This segment is also very price-sensitive and follows its own rules. These include the need for analogue solutions and the relevance of emergency and lobby phones.

Based on our many years of experience, we have intensively examined the requirements of the hotel and hospitality industry. We are now delighted to present our solutions developed specifically for this market segment on the following pages.

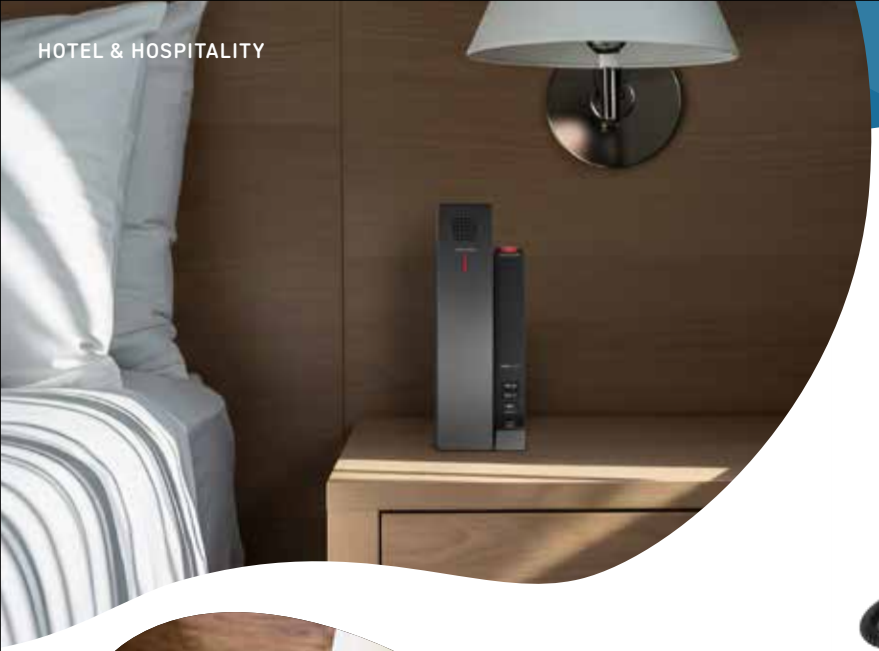

IP room telephones

Whether as a stylish design element or a frequently used device, room telephones in the hotel and hospitality industry must meet requirements that differ significantly from those of classic IP telephones in everyday office life.

Speed dial buttons for central areas such as reception or the spa, quick personalisation with individual inserts, and easy and thorough disinfection are key features here. At the same time, particularly strict data protection requirements apply: for example, call logs or telephone data from previous calls must not be stored under any circumstances.

Analogue telephones

Numerous analogue telephone systems are still in use in the hotel and hospitality industry, especially in guest rooms. In many cases, switching to modern IP infrastructures only makes economic sense as part of a comprehensive renovation. In addition, room telephony often does not meet the requirements of modern, external communication, but is mainly used for internal purposes – for example, to contact the reception, restaurant or spa.

Even though analogue technology no longer meets the standards of modern telecommunications, it remains firmly established in many businesses. For this reason, Snom offers a specially tailored analogue telephone series for precisely these transition and existing scenarios – as a pragmatic solution for existing infrastructures.

Visually, these end devices are hardly distinguishable from our IP-based telephones and fit just as elegantly into any guest room. Individual design options are also available here, depending on requirements.

Back office and reception

Clarity is a key success factor at reception. The telephone must enable staff to classify incoming calls at a glance – whether it is an external call, an internal connection from the back office or a call directly from a guest room.

Depending on the origin of the call, both the priorities and the manner of addressing the caller differ significantly. This makes it all the more important to have a large, easy-to-read display and – depending on the workload – appropriate expansion modules that enable clear visualisation and efficient call management. Of course, functions such as freely assignable speed dial keys, easy call forwarding and holding, call queues and other convenience features are part of the basic equipment of a reception telephone.

The same applies to work in the back office. Here, too, the terminal used should meet all the requirements of modern office life – from convenient telephony and clear structures to reliable integration into existing communication processes.

E303 / E303A

- Traffic Red casing
- Anti-bacterial housing
- Wall-mount included
- Off-hook auto-dial
- only E303: PoE power supply (exclusively)

When every second counts

There are situations where there is no time to think twice. When there is a medical emergency or another potentially dangerous incident, quick action is crucial in such moments.

The Snom E303 wall phone is deliberately designed to be impossible to overlook – and that is precisely its purpose. Simply lifting the receiver automatically dials a predefined number. Alternatively – or in the case of the analogue E303A version – speed dial buttons or the keypad are available. This means that help is immediately available without any additional steps being necessary.
